| Experiment No.3 |
| To install and configure MongoDB to execute NoSQL commands |
| Date of Performance:31/07/2023 |
| Date of Submission:07/08/2023 |

**AIM**: To install and configure MongoDB/ Cassandra/ HBase/ Hypertable and to execute NoSQL commands.

**THEORY**:

MongoDB can be downloaded from https://www.mongodb.com/try/download/community2

Now open command prompt and run the following command

```
C:\>move mongodb-win64-* mongodb

    1 dir(s) moved.
```

MongoDB requires a data folder to store its files. The default location for the MongoDB data directory is c:\data\db. So create the folder using the Command Prompt. Execute the following command sequence.

```
C:\>md data

C:\md data\db
```

In case mongodb is stored in some other location, navigate to that folder.

In command prompt navigate to the bin directory present into the mongodb installation folder. Suppose the installation folder is D:\set up\mongodb

```
C:\Users\XYZ>d:

D:\>cd "set up"

D:\set up>cd mongodb

D:\set up\mongodb>cd bin

D:\set up\mongodb\bin>mongod.exe --dbpath "d:\set up\mongodb\data"
```

Now to run the mongodb, open another command prompt and issue the following command:

```
D:\set up\mongodb\bin>mongo.exe

MongoDB shell version: 2.4.6

connecting to: test

>db.test.save( { a: 1 } )

>db.test.find()

{ "_id" : ObjectId(5879b0f65a56a454), "a" : 1 }

>
```

**The use Command**

MongoDB use DATABASE_NAME is used to create database. The command will create a new database, if it doesn't exist otherwise it will return the existing database

**Syntax**:

use DATABASE_NAME

**The dropDatabase () Method**

MongoDB db.dropDatabase () command is used to drop an existing database.

**Syntax**:

db.dropDatabase()

**The createCollection() Method**

MongoDB db.createCollection(name, options) is used to create collection.

**Syntax**:

db.createCollection(name, options)

**Insert Document**

To insert data into MongoDB collection, you need to use MongoDB's insert() or save()method

**Syntax**

>db.COLLECTION_NAME.insert(document)

**Example**:

>db.post.insert([

{

 title: 'MongoDB Overview',

 description: 'MongoDB is no sql database',

 tags: ['mongodb', 'database', 'NoSQL'],

 likes: 100

},

{

 title: 'NoSQL Database',

 description: 'NoSQL database doesn't have tables',

 tags: ['mongodb', 'database', 'NoSQL'],

 likes: 20,

 comments: [

 {

 user:'user1',

 message: 'My first comment',

 dateCreated: new Date(2022,11,10,2,35),

 like: 0

 }

 ]

}

])

**Creating sample document:**

**Example**

Suppose a client needs a database design for his blog website. Website has the following requirements.

☐ Every post has the unique title, description and url.

☐ Every post can have one or more tags.

☐ Every post has the name of its publisher and total number of likes.

☐ Every Post have comments given by users along with their name, message, data-time and likes.

☐ On each post there can be zero or more comments.

Document:

```
{
_id: POST_ID
title: TITLE_OF_POST,
description: POST_DESCRIPTION,
by: POST_BY,
url: URL_OF_POST,
tags: [TAG1, TAG2, TAG3],
likes: TOTAL_LIKES,
comments: [
{
user:'COMMENT_BY',
message: TEXT,
dateCreated: DATE_TIME,
like: LIKES
},
{
user:'COMMENT_BY',
message: TEXT,
dateCreated: DATE_TIME,
like: LIKES
```

```
        }

    ]

}
```

OUTPUT:

Show All Databases

Create new database

Know your current selected database

Create collection

To check collections list

Insert document in collection

```
myTestDb> db.Employee.insert({id:1 , name:'Samarth', address:'Pune'})
DeprecationWarning: Collection.insert() is deprecated. Use insertOne, insertMany, or bulkWrit
e.
{
  acknowledged: true,
  insertedIds: { '0': ObjectId("651c386283769c4480038873") }
}
myTestDb> db.Employee.insert({id:2 , name:'Shubham', address:'Ratnagiri'})
{
  acknowledged: true,
  insertedIds: { '0': ObjectId("651c387883769c4480038874") }
}
myTestDb>
```

To insert multiple documents in selected collection

```
myTestDb> db.Employee.insert({id:3 , name:'Dharmesh', address:'Malvan'},{id:4, name:'Hrushike
sh',address:'kochi'})
{
  acknowledged: true,
  insertedIds: { '0': ObjectId("651c394183769c4480038875") }
}
myTestDb>
```

Get collection document

```
myTestDb> db.Employee.find().pretty()
[
  {
    _id: ObjectId("651c386283769c4480038873"),
    id: 1,
    name: 'Samarth',
    address: 'Pune'
  },
  {
    _id: ObjectId("651c387883769c4480038874"),
    id: 2,
    name: 'Shubham',
    address: 'Ratnagiri'
  },
  {
    _id: ObjectId("651c394183769c4480038875"),
    id: 3,
    name: 'Dharmesh',
    address: 'Malvan'
  }
]
myTestDb>
```

Update document

```
myTestDb> db.Employee.update({name:'Dharmesh'},{$set:{name:'Hrushikesh'}})
DeprecationWarning: Collection.update() is deprecated. Use updateOne, updateMany, or bulkWrite.
{
  acknowledged: true,
  insertedId: null,
  matchedCount: 1,
  modifiedCount: 1,
  upsertedCount: 0
}
```

```
myTestDb> db.Employee.find().pretty()
[
  {
    _id: ObjectId("651c386283769c4480038873"),
    id: 1,
    name: 'Samarth',
    address: 'Pune'
  },
  {
    _id: ObjectId("651c387883769c4480038874"),
    id: 2,
    name: 'Shubham',
    address: 'Ratnagiri'
  },
  {
    _id: ObjectId("651c394183769c4480038875"),
    id: 3,
    name: 'Hrushikesh',
    address: 'Malvan'
  }
]
```

Drop collection

```
myTestDb> db.Employee.drop()
true
myTestDb>
```

Drop database

```
myTestDb> db.dropDatabase()
{ ok: 1, dropped: 'myTestDb' }
```

CONCLUSION:

In this experiment, the installation and configuration of MongoDB, a NoSQL database, to execute NoSQL commands. We customized it to meet our specific needs, including security and performance requirements. We learned how to use NoSQL commands for various database operations, such as inserting, querying, and indexing data. MongoDB demonstrated scalability and performance for unstructured data, making it a good choice for NoSQL applications. The availability of comprehensive documentation and community support helped us succeed, and we gained valuable skills for efficient NoSQL data management using MongoDB.
